

# Overview of SHLA Modeling Project

April 10, 2018

Jim Hatten - USGS

Gary Slater - CNLM

Jerrmaine Treadwell - CNLM

Matt Stevenson - CoreGIS

# Project objectives

Goal: Inform agencies responsible for lark habitat management & conservation

- create a GIS tool to quantify & track SHLA habitat across lower 169 km of Columbia River

- develop a probability model to remotely identify & monitor lark habitat
- make maps of lark habitat at all 25 USACE dredge disposal sites
- develop a variable that can identify lark habitat by seral stage (young, mature, old)
- characterize the distribution and stability of lark habitat within and between years

# Modeling Flow Diagram

```

The diagram illustrates the modeling flow for habitat mapping, starting with data input and ending with final habitat maps and verification.

**1) Data Input:**

- Presence/Absence:** SHLA – Ground Absence locations
- Pred. Variables:** NDVI, Deposition age, Terrain rugged
- Imagery:** Sentinel-2 (10 m), USACE (5cm)

**2) GIS (Google Earth Engine)**

**3) Spatial Database:** Presence/Absence and habitat attributes

**4) Habitat models:** Logistic Regression

**5) Select appropriate imagery scale**

**6) Habitat model Selection**

**7) Verification**

**8) 4-class variable:** Early, Optimal, Late, Unsuitable

**Binary thresholds**

**SHLA out-year: 2017**

**SHLA in-year set aside: 2016**

**Habitat Map: M3**

**Habitat Map: M4**

# Logistic Regression Modeling process

- Build main-effects model from conceptual diagram
  - Contains all significant variables from conceptual diagram (e.g., seasonal climate variables, topography, vegetation - when necessary)
  - Examine scale of covariates
  - Test for interactions
  - Look for autocorrelation (i.e., autologistic regression)
  - Calculate model-fit stats (e.g., ROC, AIC, classification table)
- Develop competing sub-models
  - Systematically remove one or more variables
  - Recompute model-fit stats
- Select most parsimonious model
  - “an accurate approximation to the interpretable information in the data at hand.”
  - Keep it as simple as possible, don’t overfit

# Use Sentinel-2 Satellite Imagery

- European Space Agency satellite (launched in summer 2015)
- 10-m spatial resolution
- Updates every 4-8 days
- Freely available to everyone
- Google Earth Engine seamlessly mosaics and  
atmospherically corrects it

# Predictor/model relationships – model 3

# Larks increase within higher model probability classes

# Lark density increases in higher probability classes: 2016 (n = 230)

Create a designer variable to predict habitat suitability based upon seral stage (young, mature, old)

Creating a 4-class predictor variable: unsuitable, Pre-suitable (young), suitable (mature), post-suitable(old)

# Proportion of larks within each suitability class

# 4-class designer variable in Google Earth Engine (2016)

# Habitat predictions for years 2016 – 2017)

# Designer variable: habitat suitability classes: 2017

# Summary

- Successfully created a new predictive model of lark habitat
- Model runs seamlessly in GEE or ArcGIS
- USACE will begin using model this summer
- Model will inform FWS' Biop and Corp disposal schedule
- Model can be adapted for many other species and locations
- Data and GEE are free!
